

# KPN Security Policy

## KSP – Rule

Title	(Web) Application Security	<pre>graph TD; A["Top level policy (mandatory)"] --&gt; B["Standards (mandatory)"]; B --&gt; C["Rules (mandatory)"]; C --&gt; D["Guidelines (supporting)"]; D --&gt; E["Tools (supporting)"];</pre>
ID	KSP-FA05-RL11	
Funct. Area	05 - System & Network security	
Date	21 April 2017	
Version	v2.10	
Status	Approved	
Owner	CISO	

### Summary

This policy defines a set of policy rules regarding the protection of (web) applications. These rules are based primarily on the OWASP Top 10 most critical web application security risks<sup>1</sup> and the Framework Secure Software by the Secure Software Foundation<sup>2</sup>.

The rules provide security only under the assumption that an application runs on a system that is hardened according to KSP-FA05-RL04 System Hardening rule.

This policy is written for all KPN NL employees and managers who are involved in developing, maintaining and testing (web) applications. It concerns all applications owned by KPN or applications from vendors/partners that are used for KPN purposes.

<sup>1</sup> The Open Web Application Security Project (OWASP) is an open community dedicated to enabling organizations to develop, purchase, and maintain applications that can be trusted.

<sup>2</sup> The Framework Secure Software is developed by the Secure Software Foundation. The framework is aimed at defining a method and controls that can be used to "measure" the security of software in an objective and repeatable manner.

### Version history

<i>Version</i>	<i>Date</i>	<i>Comments</i>
v1.0	20 August 2013	Approved in SSM
v1.1	9 October 2013	Updated based on consistency check
v2.0	19 March 2014	Updated on several comments
v2.1	3 April 2014	Updated on comments from the CISO Red Team
v2.2	1 August 2014	Updated on several comments
v2.3	23 January 2015	Updated on several comments
v2.4	20 July 2015	Missing relevant requirements from the Framework Secure Software added and about defending against Clickjacking and Brute-Force attacks.
v2.5	13 November 2015	Version number incremented due to changes in the NL version
v2.6	29 April 2016	Tightening of R20: 'all cookies' replaced by 'sensitive cookies' R38 new: setting the Strict-Transport-Security response header
v2.7	29 July 2016	R07 broadened with direct expiration of existing session(s) after successfully changing credentials R33 removed: the requirement has no added value R38 mentioning the possibility to include a domain in HSTS preload lists
v2.8	2 November 2016	R08: added additional opportunities R30: added possible exception to information disclosure R37: added possible origins R39 new: introduced mixed-content (R21) from KSP-FA05-RL07 - Cryptography into this document as R39 R40 new: user enumeration is not allowed Generic: replaced SSL with TLS
v2.9	3 February 2017	R12: Clarification to the rule as it mostly applies to virtual and shared hosting environments. R40: additional clarification on what is meant by user-enumeration.
v2.10	21 April 2017	R26: Added the URLs to the responsible disclosure statement.

### Disclaimer

The content of this document is to describe KPN's policy on this specific topic. If and when this document is partly or fully disclosed to parties outside of KPN, it's important to hereby note towards those parties that this contains KPN's intended policy and cannot in any way be read or construed to be an explicit or implied formal guarantee or promise that its content can always be fully executed or complied to.

<b>ID</b>	KSP-FA05-RL11-R01
<b>Title</b>	<u>Preventing injection using a safe API</u>
<b>Description</b>	A safe API must be used which avoids the use of the interpreter entirely or provides a parameterized interface.
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R02
<b>Title</b>	<u>Preventing injection using a non-parameterized API</u>
<b>Description</b>	If a parameterized API is not available, special characters must be carefully escaped using the specific escape syntax for that interpreter.
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R03
<b>Title</b>	<u>Preventing injection using white list input validation routines</u>
<b>Description</b>	Positive or “white list” input validation with appropriate canonicalization must be used (it is not a complete defense as many applications require special characters in their input).
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R04
<b>Title</b>	<u>Preventing Cross-Site Scripting and SQL Injections by escaping all untrusted data</u>
<b>Description</b>	All untrusted data based on the HTML context (body, attribute, JavaScript, CSS, or URL) must be carefully escaped. This escaping must be included in applications unless the UI framework does this for them.
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R05
<b>Title</b>	<u>Preventing Cross-Site Scripting using white list input validation routines</u>
<b>Description</b>	<p>Positive or “whitelist” input validation must be used. Such validation should decode any encoded input, and then validate the length, characters, format, type and range on that data before accepting the input (it is not a complete defense as many applications require special characters in their input). Perform consistency checks at various stages of information being processed.</p>
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R06
<b>Title</b>	<u>Strong authentication and session management controls</u>
<b>Description</b>	A single set of strong authentication and session management controls must be used. For the requirements see Identity and access management standard and Password security rule.
<b>Relating document</b>	KSP-FA05-ST01 - Identity and access management KSP-FA05-RL01 - Password security

<b>ID</b>	KSP-FA05-RL11-R07
<b>Title</b>	<u>Use strong session tokens and protect these</u>
<b>Description</b>	<ul style="list-style-type: none"> <li>• Session tokens may not be predictable and able to (reasonably) withstand brute-forcing attacks.</li> <li>• Session tokens must be linked to a unique user as much as possible (e.g. linked to IP address, TLS tokens, MAC address, etc.) to prevent hijacking.</li> <li>• Session tokens must not be exposed through other channels.</li> <li>• Session IDs must be strong, temporary, replaced after logging in and deleted with a timeout on the server side.</li> <li>• All existing session tokens/active sessions must directly expire once credentials have been successfully changed, so that existing sessions on other devices/apps/etc. (based on the old account information) will not remain valid until the normal session expiration time.</li> </ul>
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R08
<b>Title</b>	<u>Indirect Object References per user or session</u>
<b>Description</b>	<p>Object references should not be predictable and able to withstand brute-forcing attacks.</p> <ul style="list-style-type: none"> <li>• Per user or session indirect object references must be used.</li> <li>• The application must map the per-user indirect reference back to the actual database key, file or other object on the server.</li> </ul>
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R09
<b>Title</b>	<u>Check Access when using Direct Object References</u>
<b>Description</b>	Each use of a direct object reference from an untrusted source must include an access control check to ensure the user is authorized for the requested object.
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R10
<b>Title</b>	<u>Preventing Cross-Site Request Forgery (CSRF)</u>
<b>Description</b>	CSRF tokens may not be predictable and must be able to (reasonably) withstand brute-forcing attacks. An unpredictable token must be included in the server response, preferably in a hidden field in the form body. This token must be returned by the client and validated by the server. Such tokens must at a minimum be unique per user session, but can also be unique per request.
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R11
<b>Title</b>	<u>Updating and patching of the (web) application</u>
<b>Description</b>	All source code, including libraries that are used for generating the (web) application must be regularly updated and patched. Application (code) moving into production must be security tested via code reviews (adhere to OWASP Secure Coding practices) or penetration tests.
<b>Relating document</b>	KSP-FA05-ST02-R08 (Vulnerability Management)

<b>ID</b>	KSP-FA05-RL11-R12
<b>Title</b>	<u>Application security architecture</u>
<b>Description</b>	Shared hosting or virtual hosting must not be used without separation on all layers of the application, including the platform on which the application is active, the framework, application specific code and the database.
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R13
<b>Title</b>	<u>Encryption of sensitive data at rest</u>
<b>Description</b>	<p>Encrypt all sensitive data at rest in a manner that defends against threats.</p> <p>For the requirements see Cryptography rule.</p> <p>For information classification see Classification of information rule.</p>
<b>Relating document</b>	<p>KSP-FA05-RL07 - Cryptography</p> <p>KSP-FA03-RL01 - Classification of information</p>

<b>ID</b>	KSP-FA05-RL11-R14
<b>Title</b>	<u>Encryption of offsite backups</u>
<b>Description</b>	<p>Ensure offsite backups are encrypted, but the keys are managed and backed up separately.</p> <p>For the requirements see Cryptography rule.</p> <p>For guidelines on backup and restore see Backup guideline.</p>
<b>Relating document</b>	KSP-FA05-RL07 - Cryptography

<b>ID</b>	KSP-FA05-RL11-R15
<b>Title</b>	<u>Strong standard algorithms and keys</u>
<b>Description</b>	Ensure appropriate strong standard algorithms and strong keys are used to protect sensitive data, and key management is in place. For the requirements see Cryptography rule.
<b>Relating document</b>	KSP-FA05-RL07 - Cryptography

<b>ID</b>	KSP-FA05-RL11-R16
<b>Title</b>	<u>Passwords</u>
<b>Description</b>	Ensure passwords are hashed with a strong standard algorithm and an appropriate salt is used. For the requirements see Cryptography rule.
<b>Relating document</b>	KSP-FA05-RL07 - Cryptography

<b>ID</b>	KSP-FA05-RL11-R17
<b>Title</b>	<u>Proper authentication and authorization for each page</u>
<b>Description</b>	The enforcement mechanism(s) must deny all access by default, requiring explicit grants to specific users and roles for access to every page.
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R18
<b>Title</b>	<u>Page authorization in a workflow</u>
<b>Description</b>	If the page is involved in a workflow, it must be verified that conditions are in the proper state to allow access.
<b>Relating document</b>	N/A

<b>ID</b>	KSP-FA05-RL11-R19
<b>Title</b>	<u>Transport Layer Protection using TLS</u>
<b>Description</b>	<p>All pages with sensitive data must use TLS. Also, the location to which sensitive data is being posted to must use TLS without redirection from a non-TLS target.</p> <p>Pages containing sensitive data are:</p> <ul style="list-style-type: none"> <li>- pages displaying sensitive information, e.g. information impacting the privacy of the end-user.</li> <li>- pages which are used for consuming sensitive information, e.g. login forms.</li> </ul> <p>Possible exception: when a redirect from the non-TLS location to the TLS location ensures that the end-user is not capable of using the unsecured page.</p>

<b>ID</b>	KSP-FA05-RL11-R38
<b>Title</b>	<u>Support HTTP Strict Transport Security (HSTS)</u>
<b>Description</b>	<p>Set the Strict Transport Security response header.</p> <p>The Strict-Transport-Security response header tells the browser to not accept any untrusted, expired, or revoked TLS certificate from the domain.</p> <p>Once a supported browser receives this header that browser will prevent any communications from being sent over HTTP to the specified domain and will instead send all communications over HTTPS. It also prevents HTTPS click through prompts on browsers.</p> <p>Most major browsers (IE 11 and Edge, Firefox, Chrome, Opera, Safari) also have HSTS preload lists.</p> <p>Be aware that inclusion in the preload list cannot easily be undone. Don't request inclusion unless you're sure that you can support HTTPS for your entire site and all its subdomains the long term.</p>
