Requirement	Correct date and time
Description	The central KPN NTP platform must always be used for the synchronization of a system or platforms time. External sources are not permitted. The time zone must be configured with GMT+1.
Supplement	<p>It is important that all systems and applications have the same time at the same moment. To accomplish this, it is necessary that everything synchronizes with the same source. This way, every system or application will synchronize their local clock with the same central clock.</p> <p>Besides the fact that this accomplishes consistency in time, we also accomplish that systems are not influenceable through third party sources. Because of this, systems do not only have the correct time, but the time is also trustworthy.</p> <p>It is permitted to set up an NTP server that is used to synchronize other systems deeper in the network. In this case, the NTP server must synchronize with the central KPN NTP platform by using it as the only source. For example: Within a Windows domain it is enough if the domain controller with the PDC role is configured to use the central KPN NTP platform if all other domain servers and clients are configured to synchronize their time with the PDC.</p>

Rationale	Logging
Rationale	Connect to security services
Rationale	Configuring date and time

Requirement	Stratum 0 bronnen voor NTP servers
Description	Time sources that are part of the central KPN NTP platform must use a minimum of two different stratum 0 sources.
Supplement	<p>Stratum 0 sources are e.g. Global Navigation Satellite Systems (GNSS) like GPS or Galileo, atom clocks, or the radio signal DCF77.</p> <p>It is only permitted to use GNSS as a time source when mitigations are implemented against spoofing or jamming of the GNSS signal. This can be done by implementing e.g. a GPS firewall or a reference clock that must be used to detect the skew of time.</p>
