Ruud Leurs

Requirement	Network availability
Description	The design of a network must ensure the required level of availability.
Supplement	Due to the function of a network component (handling traffic), different data streams for different services are transported. The highest availability requirement of the data streams prescribes the measures that must be taken for a network infrastructure. If a service must be "always on", robust components must be used and device- or location redundancy must be implemented. The service description of the network enables the end user to be aware of possible continuity interruptions and the duration and extent of this. It is up to the end user to take suitable measures.
ID	KSP-RE-562
Version	1.1
Date	August 16, 2018
Rationale	Designing to availability level
